HUMAID — Frequently Asked Questions

Short answers to the questions buyers and organizations ask most about the Humanitarian Trading Token.

About the project

What is HUMAID? A digital token on BNB Chain designed to turn buying and trading into support for humanitarian work. A fixed share of every transaction goes automatically to partner humanitarian organizations.

What does the name mean? HUMAID combines Human and Aid. Its full name is the Humanitarian Trading Token.

What makes it different from other charity tokens? Three things: donations are made by the smart contracts themselves and never pass through the founder's wallet; the founder's share is publicly locked for 5 years; and unsold tokens are burned rather than kept by anyone.

Is it an investment? No. It is a way to contribute to good causes. The token is tradable, but its price is not guaranteed and no profit is promised.

Donations and organizations

How much goes to organizations? 40% of each sale phase's proceeds, and 50% of the 1% trading fee on every transfer.

Do donations pass through the founder's wallet? No. The smart contract splits each amount as it arrives and sends the organizations' share to a smart donation splitter that pays out only to registered organizations' wallets. Any change of organizations or their shares is announced on-chain 7 days before it takes effect.

Which organizations benefit? Their names will be announced after written agreements are signed. No organization will be named without its consent.

Do funds go directly to people in affected countries? No. Donations go only to the organizations, which decide how aid is delivered under their own procedures and licenses.

Can donations be earmarked for a country or program? Yes, by agreement with the partner organization and through its own earmarking mechanisms, such as food, water or education programs.

How can I verify donations arrived? Every transfer is recorded on the blockchain. A public dashboard will show what each organization received, with a link to each transaction.

The token and buying

How many tokens are there? 10 million at most, issued once and never increased.

How are they allocated? 60% for sale in 3 phases, 10% for trading liquidity, and 30% as the founder’s locked share.

What can I pay with? USDT or USDC only, on BNB Chain (also known as BEP20).

My USDT is on another network. What should I do? Move it to BNB Chain from the exchange you use by choosing the BEP20 network when withdrawing. Paying from the wrong network can mean losing the funds.

What is the price? During the sale phases: $0.10 in the Founding Supporters phase, then $0.15 in the Supporters phase, then $0.20 in the Community phase. After that, supply and demand in the market set the price.

How long do the sale phases last? Each phase lasts up to 2 months and closes early if it sells out. The full sale lasts 6 months at most.

What is the waitlist? A period of 3 to 4 weeks before Phase 1 where you register your interest, so you receive the details and start date first.

Are there purchase limits? The minimum is $10 and the maximum is 50,000 tokens per person in each phase, so tokens are spread across as many supporters as possible.

What happens to unsold tokens? They are permanently burned by the smart contract at the end of each phase, reducing total supply.

What is the trading fee? 1% per transfer, half of which goes to organizations. It can never be raised after launch, only lowered.

When does trading start? After all three sale phases end, on a decentralized exchange on BNB Chain.

Security and trust

Can the founder suddenly sell their share? No. The founder’s 3 million tokens are locked in a smart contract for 5 years, then released gradually over 36 months. The lock address is public for anyone to verify.

Can liquidity be pulled from the market? No. Liquidity is added in 3 tranches, each locked in a smart contract for 1 year from the date it is added.

Can new tokens be created later? No. The contract does not allow any minting after the initial issuance.

Is the smart contract secure? We tested it with 48 automated tests and a full run on testnet, and published the test report. The contract code is public and verified on BscScan for anyone to review. No independent audit firm has reviewed it yet.

Can you change the rules after launch? The core rules are fixed once deployed: supply, prices, locks and sale limits. Only two things can change: the fee can be lowered (never raised), and the beneficiary organizations can be changed with 7 days' public notice.

How do I protect myself from scams? Buy only through the official website or the contract address published there. We will never message you asking for your wallet's secret words, and we will never offer private sales by message.

Risks and legal status

Can the token's price fall? Yes. The price of any digital token rises and falls, and you may lose part of what you paid. Only buy what you can afford to lose.

Is buying the token allowed in my country? Cryptocurrency laws differ from country to country. Check your local laws before buying.

When is the launch? Not yet set. We will announce it to the waitlist first.
